20 ready-to-use video generation prompts

INTRODUCTION

Why Video is the #1 Growth Lever

Static images got you here. Video gets you to the next level.

Every major platform has made the same bet: **video-first algorithms.** Instagram gives Reels 3x the organic reach of static posts. TikTok is video. YouTube Shorts crossed 70 billion daily views. The math is simple — if you're not creating video, you're leaving 80% of your potential reach on the table.

For AI influencers, this used to be a problem. Image generation was mature. Video generation was not. The outputs looked janky, uncanny, obviously fake. That changed in 2026.

> THE INFLECTION POINT
>
> Kling 3.0 dropped in late 2025 and changed the game. 10-second clips with consistent characters, realistic motion, and controllable camera work. SeeDance 2.0 followed with dance and performance mapping. Wan 2.2 made it open-source. **The "good enough" threshold has been crossed.**

This guide gives you the exact workflow to turn your existing AI character images into scroll-stopping video content. No theory. No fluff. Just the tools, the settings, and the prompts that work.

What You'll Learn

- **The complete AI video toolkit** — which tools to use and when
- **Image-to-video workflow** — animate your AI characters in minutes
- **Motion control** — cinematic camera movements and character animation
- **Dance and performance content** — trend recreation and lip sync
- **Post-production pipeline** — editing, upscaling, and export settings
- **Viral formulas** — proven video formats that drive engagement

INTRODUCTION

The Numbers Don't Lie

3x

More reach on Instagram Reels vs. static carousel posts, on average.

68%

Higher engagement rate for AI influencer video content vs. image-only accounts.

10s

Generation time for a Kling 3.0 Pro clip. From still to motion in seconds.

$0.12

Cost per video with Wan 2.2 running on an RTX 4090. Near-zero marginal cost.

PREREQUISITES

This guide assumes you already have an established AI character with consistent image generation (see the **AI Image Mastery** guide). You don't need coding skills. You don't need a GPU for the cloud-based tools. Budget $30–50/month for the premium tiers.

Let's build your video pipeline.

MODULE 01

The Toolkit

Four tools. That's all you need. Each one has a specific job, and knowing when to reach for which one is half the battle.

Kling 3.0 — Your Primary Weapon

KlingAI's flagship model. Best-in-class for image-to-video with character consistency. The Pro tier gives you 10-second clips at 1080p with motion control, and the quality is genuinely impressive.

- **Best for:** Character animation, lifestyle content, product shots
- **Image-to-video:** Upload your AI character image → describe motion → generate
- **Text-to-video:** Works but less consistent for established characters
- **Motion Control:** Camera paths, zoom, pan, orbit — all adjustable
- **Cost:** ~$0.30 per generation (Pro plan), 66 credits/month at $8/mo

SeeDance 2.0 — Dance & Performance

The specialist. Feed it a reference dance video and your AI character image, and it maps the motion onto your character. The results are shockingly good for trend recreation.

- **Best for:** Dance trends, performance videos, choreographed content
- **Input:** Reference video + character image → motion-mapped output
- **Limitation:** Works best with full-body shots and clear backgrounds
- **Cost:** Free via Replicate (~$0.05/gen) or run locally with a 24GB GPU

The Toolkit (continued)

Wan 2.1 / 2.2 — Open Source Power

Alibaba's open-source video generation model. Run it locally for zero per-generation cost, or use it through Replicate and Hugging Face for cheap API access. Version 2.2 added significant quality improvements.

- **Best for:** Batch generation, experimentation, budget-conscious creators
- **Local setup:** Requires 24GB+ VRAM (RTX 4090 or A6000)
- **Cloud:** Replicate API at ~$0.08–0.12 per generation
- **Limitation:** Slightly less consistent character fidelity than Kling 3.0
- **Cost:** Free (local) or ~$0.10/gen (cloud)

Veo 3.1 — Google's Contender

Google DeepMind's latest. Exceptional at cinematic quality and natural physics. Access through Google AI Studio or the Vertex AI API. The built-in audio generation is a unique advantage.

- **Best for:** Cinematic content, natural movement, audio-inclusive clips
- **Unique feature:** Native audio generation — ambient sound matched to scene
- **Access:** Google AI Studio (free tier) or Vertex AI API
- **Limitation:** Less control over specific character consistency
- **Cost:** Free tier available, Pro at ~$0.20/gen

THE SMART STACK

Kling 3.0 for your hero content (the posts that matter). **SeeDance 2.0** for dance trends and performance clips. **Wan 2.2** for batch generation and experimentation. **Veo 3.1** for cinematic one-offs where audio matters. Don't try to use one tool for everything.

Cost Comparison

TOOL	COST / VIDEO	MONTHLY PLAN	BEST USE
Kling 3.0 Pro	~$0.30	$8/mo (66 credits)	Hero content
SeeDance 2.0	~$0.05	Pay-per-use	Dance / performance
Wan 2.2 (local)	~$0.12*	Free (electricity)	Batch / experimentation
Wan 2.2 (cloud)	~$0.10	Pay-per-use	No GPU option
Veo 3.1	~$0.20	Free tier + Pro	Cinematic / audio

*Wan 2.2 local cost based on estimated electricity for RTX 4090 generation.

Setup Checklist

01 Create a KlingAI Account

Go to klingai.com → Sign up → Subscribe to the Pro plan ($8/mo). This is your bread and butter. Don't skip it.

02 Set Up SeeDance Access

Access through Replicate (replicate.com) or Hugging Face Spaces. No dedicated account needed — just an API key or free Space.

03 Google AI Studio Access

Go to aistudio.google.com → Sign in with Google → Enable Veo 3.1. Free tier gives you 50 generations per day.

04 Optional: Local Wan 2.2 Setup

If you have a 24GB+ GPU: install ComfyUI → download the Wan 2.2 model weights → add the Wan video nodes. Full guide at wan-ai.org.

MODULE 02

Image-to-Video Workflow

This is the core skill. You already have great AI character images. Now you make them move.

The workflow is deceptively simple: **upload your image → write a motion prompt → generate → review → refine.** The magic is in the motion prompt — how you describe the movement determines everything.

Step 1: Prepare Your Source Image

Not every image works well for animation. The best source images for video generation share specific traits:

- **Clean composition** — character clearly visible, not cropped awkwardly
- **Neutral or slight expression** — extreme expressions limit animation possibilities
- **Proper aspect ratio** — 9:16 for Reels/TikTok, 16:9 for YouTube, 1:1 for feed
- **High resolution** — minimum 1024×1024, ideally higher
- **Good lighting** — even, flattering light gives the model more to work with

> PRO TIP
>
> Generate your source image specifically for video. In Nano Banana Pro, add "poised, neutral expression, slight head tilt, even studio lighting" to your prompt. This gives Kling maximum flexibility for the animation.

Step 2: Kling 3.0 Pro Settings

Open KlingAI → Select "Image to Video" → Upload your source image. Then configure:

- **Model:** Kling 3.0 (not 2.x — the difference is significant)
- **Mode:** Pro (Standard works but Pro is noticeably better)
- **Duration:** 5s for first tests, 10s for final content
- **Aspect Ratio:** Match your source image
- **Motion Intensity:** Start at 5/10, adjust based on content type
- **Negative Prompt:** "distortion, morphing, blurry, jittery, glitch"

MODULE 02

Motion Prompting

The motion prompt is everything. A bad prompt wastes your credits. A great prompt creates content that stops scrolls. Here's the framework:

THE MOTION PROMPT FORMULA

[Subject Action] + [Body Details] + [Expression/Mood] + [Camera Movement] + [Environment Detail]

Example: "The woman slowly turns her head to the right, her hair gently swaying. She gives a soft, confident smile. Subtle camera push-in. Warm golden hour light."

5 Example Prompts (with Explanations)

PROMPT 01 — THE SLOW TURN

"The woman slowly turns her head from left to right, her eyes meeting the camera with a confident gaze. Hair moves naturally with the motion. Slight smile forms on her lips. Cinematic, 24fps feel."

Why it works: Simple, clear motion. One primary action. Specific details about expression and hair physics.

PROMPT 02 — WALKING TOWARD CAMERA

"The woman walks confidently toward the camera on a city street, maintaining eye contact. Her outfit moves naturally with each step. Shallow depth of field, background softly blurred. Smooth tracking shot."

Why it works: Combines character motion with camera style. Depth of field instruction creates cinematic quality.

PROMPT 03 — THE HAIR FLIP

"The woman tosses her hair back with a quick, playful motion, then looks directly at the camera with a bold expression. Wind catches the hair mid-flip. Bright, high-contrast lighting."

Why it works: Dynamic action with specific physics. The wind detail helps the model create realistic hair movement.

MODULE 02

Duration & Aspect Ratio Guide

PLATFORM	ASPECT RATIO	OPTIMAL LENGTH	GENERATION SETTING
Instagram Reels	9:16	7–15 seconds	10s clip, trim in edit
TikTok	9:16	7–30 seconds	10s clip, loop or extend
YouTube Shorts	9:16	15–60 seconds	Multiple 10s clips stitched
Instagram Feed	1:1 or 4:5	3–10 seconds	5s clip, loop
Twitter/X	16:9 or 1:1	6–15 seconds	10s clip

STITCHING MULTIPLE CLIPS

For longer content, generate multiple 10-second clips and stitch them in CapCut. The trick: use the **last frame of clip A as the source image for clip B.** This maintains visual continuity between segments. Screenshot the final frame, use it as input for the next generation.

Common Mistakes to Avoid

- **Overcomplicating the prompt** — one clear action per clip beats three conflicting ones
- **Ignoring aspect ratio** — mismatched ratios crop your character awkwardly
- **Setting motion intensity too high** — leads to distortion and warping artifacts
- **Skipping the negative prompt** — always include "distortion, morphing, blurry" at minimum
- **Using low-res source images** — garbage in, garbage out applies doubly for video

MODULE 03

Motion Control

Motion control is what separates amateur AI video from cinematic AI video. It's the difference between a static image that slightly moves and a clip that feels like it was shot by a professional camera operator.

Kling 3.0's Motion Control feature lets you define camera paths independently from character movement. This is powerful — and most people don't use it.

The Six Camera Movements

Pan

Camera moves horizontally. Left-to-right reveals are great for "room tour" and "outfit check" content. Use sparingly — it can feel jarring on short clips.

Tilt

Camera moves vertically. Tilt-up from feet to face is classic for "outfit reveal" videos. Tilt-down works for dramatic reveals.

Zoom

Push in for intimacy, pull out for context. Slow zoom-in on face during emotional content. Zoom-out to reveal environment or surprise element.

Orbit

Camera circles the subject. The most cinematic option. Even a quarter-orbit (90°) adds massive production value. Best for beauty and fashion content.

Track

Camera follows the subject's movement. Essential for walking shots. Keeps the character centered while the background moves naturally.

Static

No camera movement. Underrated. Lets the character's motion speak for itself. Best for reaction content and talking-head style clips.

Combining Character + Camera Motion

The real magic happens when you layer character animation with camera movement. Here are proven combinations:

01 Walk + Track (Follow Shot)

Character walks forward. Camera tracks alongside or follows behind. Classic influencer "walking through the city" content. Set motion intensity to 6/10.

02 Head Turn + Slow Zoom (The Reveal)

Character turns head toward camera as camera slowly pushes in. Perfect for "POV: someone calls your name" content. Extremely engaging hook.

03 Pose + Orbit (Beauty Shot)

Character holds a pose or makes subtle movements while camera orbits 90°. Fashion and beauty content staple. Set orbit speed to slow — fast orbits look cheap.

04 Gesture + Static (The Reaction)

Character reacts with expression or gesture. No camera movement. Lets the performance carry the clip. Best for meme-style content and reactions.

05 Full Body + Tilt Up (The Reveal)

Camera starts at feet, tilts up slowly to reveal full outfit/character. The "Get Ready With Me" payoff shot. Set tilt speed to match music beat if using audio.

COMMON MISTAKE

Don't combine complex character motion with complex camera motion. If the character is doing a lot (dancing, walking, gesturing), keep the camera simple (static or slow zoom). If the character is still, that's when you go cinematic with the camera. **One element leads, the other supports.**

Motion Control Settings Reference

CONTENT TYPE	CHARACTER MOTION	CAMERA	INTENSITY
Talking head	Subtle gestures, expressions	Static or slow zoom	3–4/10
Fashion / OOTD	Pose, hair flip, turn	Orbit or tilt	5–6/10
Lifestyle / Day-in-life	Walking, typing, daily action	Track or pan	5–6/10
Reaction / POV	Expression change, gesture	Static	4–5/10
Cinematic / Mood	Minimal — slow breathing	Slow orbit + zoom	2–3/10
Dance / Performance	Full body motion	Static or slow track	7–8/10

Troubleshooting Artifacts

- **Warping / morphing face:** Reduce motion intensity to 3–4. Add "maintain facial consistency, no morphing" to prompt. Use negative prompt: "face distortion, warping."
- **Jittery movement:** This usually means conflicting motion instructions. Simplify your prompt to one primary action.
- **Character drifting off-frame:** Add "character stays centered in frame" to prompt. Reduce motion intensity.
- **Unnatural hand movement:** Hands are still the hardest part. Avoid prompts that require detailed hand actions. Keep hands in pockets, on hips, or out of frame when possible.
- **Background warping:** Add "stable background, no distortion" to prompt. Use source images with simpler backgrounds.

MODULE 04

Dance & Performance Videos

Dance trends are the fastest path to viral content on TikTok and Reels. The problem was always getting an AI character to dance convincingly. SeeDance 2.0 solves this.

The concept is simple: you provide a reference video of someone performing a dance or action, plus your AI character image, and SeeDance maps the motion from the reference onto your character. The result is your AI influencer performing that exact choreography.

SeeDance 2.0 Workflow

01 Find Your Reference Video

Browse TikTok or Instagram for trending dances. Download the reference clip — you need the actual video file. Use SaveTT.cc or similar to download. The cleaner the reference (clear body visibility, simple background), the better the output.

02 Prepare Your Character Image

Use a full-body shot of your AI character. Standing pose works best. Clean background (solid color or simple environment). Resolution should be at least 768×1024. The pose should roughly match the starting pose of the reference video.

03 Run SeeDance 2.0

Upload both files to SeeDance (via Replicate API or Hugging Face Space). Set output resolution to match your target platform. Processing takes 2–5 minutes depending on clip length. Generate 2–3 variations and pick the best.

04 Review and Clean Up

Check for artifacts, especially around hands and feet. Minor glitches can be hidden with CapCut transitions, text overlays, or strategic cropping. If the output is too glitchy, try a different source image pose.

MODULE 04

Lip Sync & Audio Matching

Lip sync adds another layer of realism to your AI content. While perfect sync is still evolving, there are reliable approaches that work today.

Method 1: Audio-Driven Lip Sync

Use tools like Hedra or Sync Labs to add lip movement to your AI video. Upload your generated video + an audio file, and the tool maps mouth movements to match the speech.

- **Best for:** Voiceover content, "speaking to camera" clips
- **Quality:** 7/10 — good enough for most content, not perfect
- **Cost:** Hedra starts at $8/mo, Sync Labs has pay-per-use

Method 2: Music Video Approach

Skip lip sync entirely. Use your AI video clips as a music video — overlay trending audio, let the movement match the vibe rather than the lyrics. This is actually how most viral AI content works.

- **Best for:** Dance content, aesthetic/mood videos, trend recreation
- **Quality:** 10/10 — no sync issues because there's nothing to sync
- **Cost:** Free (just add music in CapCut)

Creating "Reaction" and "POV" Content

These formats are massive on Reels and TikTok, and they're perfect for AI video because they require minimal complex motion:

- **POV: Someone compliments you** — Generate a subtle smile reaction. Static camera. 3–5 seconds. Add text overlay with the scenario.
- **POV: You see your ex** — Hair flip + confident walk. Track camera. Layer trending audio.
- **When he says [X]** — Expression change from neutral to [reaction]. Static camera. Close-up framing. The simpler the motion, the more believable.

Best Practices for Performance Content

FINDING THE RIGHT REFERENCE VIDEOS

Not all reference videos work equally well with SeeDance 2.0. Here's what to look for:

✓ Good Reference Videos

- Full body visible throughout the entire clip
- Simple, uncluttered background (solid wall, studio)
- Consistent lighting — no dramatic shadows or flashing
- Single person (multi-person confuses the motion extraction)
- Smooth, deliberate movements (not erratic or extremely fast)
- 15 seconds or less (shorter = higher quality output)

✕ Bad Reference Videos

- Frequent camera cuts or angle changes
- Person partially obscured or going off-frame
- Multiple people dancing (confuses pose detection)
- Very fast, complex choreography (quality drops sharply)
- Low resolution or heavy motion blur

Scaling Dance Content

Once you find a workflow that produces good results, scale it:

1. **Save a library of 20–30 proven reference dances** — clips you know work well with SeeDance
2. **Generate 3 character outfits** — same character, different looks, using your image generation pipeline
3. **Batch generate** — each reference × each outfit = dozens of unique clips from minimal effort
4. **Schedule releases** — one dance video per day keeps the algorithm engaged

This batch approach turns dance content from a creative grind into a repeatable system.

MODULE 05

Post-Production

Raw AI-generated video is your starting point, not your final product. Post-production is where you turn a good clip into a scroll-stopping piece of content. The difference between 1K views and 100K views is often in the edit.

CapCut Editing Workflow

CapCut is the standard for short-form video editing. It's free, fast, and built for Reels/TikTok content. Here's the workflow:

01 Import & Trim

Import your AI-generated clip. Trim the first and last 0.5 seconds — AI video models often have slight artifacts at the start/end. Cut to the cleanest portion.

02 Add Music / Audio

Choose trending audio from CapCut's library or import your own. Match the energy of the visual to the audio. Time cuts and key moments to beat drops.

03 Text Overlays

Add hook text in the first 1–2 seconds. Use CapCut's built-in text styles or create consistent branded text. Font: bold sans-serif, white with subtle shadow.

04 Color Grade

AI video often looks slightly flat. Add a subtle contrast boost (+10–15%), slight warmth (+5 temperature), and a touch of saturation (+10%). Don't overdo it.

05 Export

Export at 1080p, 30fps (or 60fps for dance content). H.265 codec if available. Maximum quality settings. File size shouldn't exceed 50MB for most platforms.

MODULE 05

Upscaling & Quality Enhancement

AI-generated video at native resolution can look soft or slightly compressed. Upscaling fixes this and adds a professional polish that separates your content from the crowd.

Topaz Video AI

The gold standard for video upscaling. Takes your 1080p AI video and enhances it to crisp, detailed 4K. The "Iris" model is specifically good for face enhancement.

- **Best settings:** Iris model, 2x upscale, De-noise at 15, Sharpen at 20
- **Processing time:** ~3–5 minutes per 10-second clip on a decent GPU
- **Cost:** $199 one-time purchase (worth it if you're serious)

Free Alternative: Real-ESRGAN (Video)

Open-source upscaler that runs locally. Not as refined as Topaz but significantly better than raw output.

- **Best settings:** RealESRGAN_x4plus model, 2x scale
- **Processing time:** Slower than Topaz, ~8–10 minutes per clip
- **Cost:** Free

Export Settings Quick Reference

PLATFORM	RESOLUTION	FPS	CODEC	MAX SIZE
Instagram Reels	1080 × 1920	30	H.264	250 MB
TikTok	1080 × 1920	30–60	H.264	287 MB
YouTube Shorts	1080 × 1920	30–60	H.264/H.265	256 MB
Twitter/X	1920 × 1080	30–60	H.264	512 MB

MODULE 05

Batch Processing for Scale

Once your workflow is dialed in, the goal is volume. Here's how to turn a 1-video-per-day habit into a 5-video-per-day machine:

The Batch Pipeline

1. **Monday: Generate source images.** Create 10–15 character images in different poses, outfits, and settings using your image pipeline.
2. **Tuesday: Generate videos.** Run all images through Kling 3.0 and SeeDance 2.0. Queue them up and let them process. Aim for 20+ raw clips.
3. **Wednesday: Upscale.** Batch-process all videos through Topaz Video AI. Queue overnight if needed.
4. **Thursday: Edit.** Open CapCut, assembly-line your edits. Trim, add audio, text overlays, color grade. Export all.
5. **Friday: Schedule.** Upload everything to your scheduling tool. Set posts for the next 1–2 weeks.

ASSEMBLY LINE MINDSET

Don't create one video from start to finish, then start the next. Do all your image generation at once. All your video generation at once. All your editing at once. **Batching the same task is 3–4x faster** than switching between different tasks constantly. Your brain (and your GPU) work better in focused mode.

Recommended Posting Cadence

- **Instagram Reels:** 1–2 per day (more gets throttled)
- **TikTok:** 2–3 per day (algorithm rewards volume)
- **YouTube Shorts:** 1 per day (consistency > volume)
- **Twitter/X:** 1–2 per day (engagement timing matters more)

MODULE 06

Viral Video Formulas

Going viral isn't random. It's formulaic. These five video formats consistently drive high engagement for AI influencer accounts. Each one is optimized for the way people scroll — hook in the first second, payoff before they swipe.

01 "Get Ready With Me" (GRWM)

Format: Multiple clips stitched — outfit reveal, hair styling moment, final look reveal.
Hook: "Getting ready for [event/situation]..." (text overlay on clip 1)
Middle: 2–3 transition shots showing different angles or stages
CTA: Final reveal shot with "Rate this look? 💬 " or "Outfit deets in bio"
Length: 12–20 seconds
Generation: 3 separate Kling clips → stitch in CapCut → add trending GRWM audio

02 Dance Trend Recreation

Format: Your AI character performing the current trending dance.
Hook: The dance itself IS the hook — first beat catches attention
Middle: Full choreography, matching the original trend closely
CTA: "Duet this 💃 " or "She ate this up 🔥 " (engagement bait in comments)
Length: 7–15 seconds (match the original trend length)
Generation: SeeDance 2.0 with trending reference → clean up in CapCut → sync original audio

Viral Formulas (continued)

03 POV Storytelling

Format: Text-driven narrative with your AI character reacting/performing.
Hook: "POV: [relatable scenario]" text overlay in first frame
Middle: Character performs the appropriate reaction or action
CTA: "Tag someone who does this 😂 " or "Part 2? 👀 "
Length: 5–10 seconds (short = rewatchable = higher loop count)
Generation: Single Kling clip with reaction prompt → add POV text in CapCut → trending audio

04 Before / After Transformation

Format: Split-screen or transition between two states of your character.
Hook: The "before" state — casual, messy, undone look
Middle: Quick transition effect (CapCut has great presets for this)
CTA: "Which version? 1 or 2?" or "Glow-up check ✨ "
Length: 7–12 seconds
Generation: Two Kling clips (casual + glam character images) → CapCut transition → beat-synced audio

05 Day-in-the-Life Montage

Format: Multiple short clips showing your AI character's "daily routine."
Hook: "A day in my life as a [character identity]" text overlay
Middle: 4–5 quick scenes: morning coffee, working, walking, sunset
CTA: "Would you live this life? 💭 " or "Follow for daily content"
Length: 15–30 seconds
Generation: 4–5 separate Kling clips → stitch in CapCut → lo-fi or trending audio

MODULE 06

Optimal Video Lengths by Platform

PLATFORM	SWEET SPOT	MAX BEFORE DROP-OFF	LOOP POTENTIAL
Instagram Reels	7–15 seconds	30 seconds	High (short = more loops)
TikTok	7–21 seconds	60 seconds	Very high
YouTube Shorts	15–45 seconds	60 seconds	Moderate
Twitter/X	6–15 seconds	30 seconds	Moderate (autoplay)

THE LOOP STRATEGY

The algorithm measures "completion rate" — what percentage of viewers watch to the end. Short videos get watched multiple times (looped), which counts as multiple completions. A 7-second video watched 3 times beats a 30-second video watched once. **When in doubt, shorter wins.**

The Hook Formula

Every successful short-form video follows this structure:

1. **Hook (0–1.5 seconds):** Visual or text that stops the scroll. This is non-negotiable. If they don't stop, nothing else matters.
2. **Payoff (1.5–8 seconds):** The content they stopped for. Make it satisfying. Match the hook's promise.
3. **CTA (last 2 seconds):** Give them something to do — comment, share, follow, check bio. Even a simple "👀" text overlay with a question works.

Nail the hook. The rest is execution.

BONUS

Prompt Library

Copy-paste ready. Each prompt is tested with Kling 3.0 Pro and optimized for consistent, high-quality output. Adjust character descriptions to match your AI influencer.

Lifestyle & Casual

01 — MORNING COFFEE

"The woman sits in a sunlit café, bringing a coffee cup to her lips. She takes a slow sip, then lowers the cup with a relaxed smile. Warm, golden morning light. Shallow depth of field. Slow camera push-in."

02 — CITY WALK

"The woman walks confidently down a busy city street, hair gently blowing in the breeze. She glances at the camera with a subtle smirk. Tracking shot from the side, slightly low angle. Urban background with bokeh lights."

03 — SUNSET SILHOUETTE

"The woman stands on a rooftop at golden hour, wind gently moving her hair and dress. She turns slowly to face the camera. Warm orange backlight creates a soft glow. Static camera, cinematic wide shot."

04 — PHONE SCROLL

"The woman sits on a couch, casually scrolling her phone. She sees something surprising, raises her eyebrows and smiles. Cozy interior lighting. Medium close-up, static camera."

Fashion & Beauty

05 — OUTFIT REVEAL

"The woman steps forward into frame, showing off her full outfit. She does a slow spin, hands on hips, then faces the camera with a confident pose. Studio lighting. Camera tilts up from feet to face."

BONUS

Prompt Library (continued)

07 — MIRROR SELFIE

"The woman poses in front of a large mirror, adjusting her outfit. She holds up her phone as if taking a selfie, tilts her head and smiles. Modern bathroom or closet setting. Static camera."

08 — JEWELRY CLOSE-UP

"Close-up of the woman touching a necklace at her collarbone. She looks down, then up at the camera with a soft smile. Dramatic lighting highlights the jewelry. Slow zoom out to medium shot."

Cinematic & Mood

09 — RAIN WINDOW

"The woman sits by a rain-streaked window, looking outside pensively. She turns slowly toward the camera. Moody blue lighting reflects off the glass. Slow orbit camera movement. Melancholic atmosphere."

10 — NIGHT CITY

"The woman walks through neon-lit city streets at night. Colorful reflections on wet pavement. She looks over her shoulder at the camera. Tracking shot, cinematic anamorphic feel. Bokeh from city lights."

11 — DRAMATIC ENTRANCE

"The woman pushes open double doors and walks through them toward the camera. Dramatic backlighting silhouettes her figure. She steps into the light revealing her face. Slow-motion feel."

12 — BEACH SUNSET

"The woman walks along the shoreline at sunset, waves gently washing over her feet. She pauses, looks out at the ocean, then turns to camera. Golden hour light. Wide tracking shot transitioning to medium."

BONUS

Prompt Library (continued)

15 — THE SHOCK

"The woman's expression shifts from neutral to wide-eyed shock. Her mouth opens slightly, she brings her hand to her chest. Dramatic pause, then a slow smile. Close-up, static camera."

16 — THE WINK

"The woman looks directly at the camera, gives a slow deliberate wink, then a knowing smile. She tilts her head slightly. Warm, flattering lighting. Close-up framing. Static camera."

Action & Dynamic

17 — WORKOUT / FITNESS

"The woman performs a yoga pose in a bright, airy studio. She moves smoothly from one position to the next with controlled grace. Natural light from large windows. Wide shot, static camera."

18 — CAR VIBES

"The woman sits in the passenger seat of a car, vibing to music. She nods her head to the beat, mouths lyrics. Sunlight streams through the window. Medium shot, slight sway from car movement."

19 — COOKING SCENE

"The woman stands at a modern kitchen counter, stirring a pan. She picks up an ingredient, adds it to the pan. Steam rises. She tastes with a spoon and nods approvingly. Warm kitchen lighting. Medium shot."

20 — DANCING SOLO

"The woman dances freely in her living room, moving to an invisible beat. Natural, joyful movement — not choreographed. She laughs mid-dance. Warm interior lighting. Wide shot, static camera."

AI INFLUENCER BLUEPRINT

Start Creating.

You have the tools. You have the workflow. You have the prompts. The only thing left is execution.
